(property === 'r') {Ð   this.updateLabelPosition();Ð }Ð isImage = !!
this.shape.get('image');Ð if (isImage != this.isImage) {Ð   this.isImage =
isImage;Ð   this.config.style = jvm.$.extend(true, {}, this.shape.style);Ð
this.createShape();Ð }Ð};/**Ð* Creates map, draws paths, binds events.Ð*
@constructorÐ* @param {Object} params Parameters to initialize map with.Ð*
@param {String} params.map Name of the map in the format
<code>territory_proj_lang</code> where <code>territory</code> is a unique
code or name of the territory which the map represents (ISO 3166 standard is
used where possible), <code>proj</code> is a name of projection used to
generate representation of the map on the plane (projections are named
according to the conventions of proj4 utility) and <code>lang</code> is a
code of the language, used for the names of regions.Ð* @param {String}
params.backgroundColor Background color of the map in CSS format.Ð* @param
{Boolean} params.zoomOnScroll When set to true map could be zoomed using
mouse scroll. Default value is <code>true</code>.Ð* @param {Boolean}
params.zoomOnScrollSpeed Mouse scroll speed. Number from 1 to 10. Default
value is <code>3</code>.Ð* @param {Boolean} params.panOnDrag When set to
true, the map pans when being dragged. Default value is <code>true</code>.Ð*
@param {Number} params.zoomMax Indicates the maximum zoom ratio which could
be reached zooming the map. Default value is <code>8</code>.Ð* @param
{Number} params.zoomMin Indicates the minimum zoom ratio which could be
reached zooming the map. Default value is <code>1</code>.Ð* @param {Number}
params.zoomStep Indicates the multiplier used to zoom map with +/- buttons.
Default value is <code>1.6</code>.Ð* @param {Boolean} params.zoomAnimate
Indicates whether or not to animate changing of map zoom with zoom buttons.Ð*
@param {Boolean} params.regionsSelectable When set to true regions of the map
could be selected. Default value is <code>false</code>.Ð* @param {Boolean}
params.regionsSelectableOne Allow only one region to be selected at the
moment. Default value is <code>false</code>.Ð* @param {Boolean}
params.markersSelectable When set to true markers on the map could be
selected. Default value is <code>false</code>.Ð* @param {Boolean}
params.markersSelectableOne Allow only one marker to be selected at the
moment. Default value is <code>false</code>.Ð* @param {Object}
params.regionStyle Set the styles for the map's regions. Each region or
marker has four states: <code>initial</code> (default state), <code>hover</
code> (when the mouse cursor is over the region or marker), <code>selected</
code> (when region or marker is selected), <code>selectedHover</code> (when
the mouse cursor is over the region or marker and it's selected
simultaneously). Styles could be set for each of this states. Default value
for that parameter is:Ð<pre>{Ð initial: {Ð   fill: 'white',Ð   "fill-opacity":
1,Ð   stroke: 'none',Ð   "stroke-width": 0,Ð   "stroke-opacity": 1Ð },Ð
hover: {Ð   "fill-opacity": 0.8,Ð   cursor: 'pointer'Ð },Ð selected: {Ð
fill: 'yellow'Ð },Ð selectedHover: {Ð }Ð}</pre>Ð* @param {Object}
params.regionLabelStyle Set the styles for the regions' labels. Each region
or marker has four states: <code>initial</code> (default state), <code>hover</
code> (when the mouse cursor is over the region or marker), <code>selected</
code> (when region or marker is selected), <code>selectedHover</code> (when
the mouse cursor is over the region or marker and it's selected
simultaneously). Styles could be set for each of this states. Default value
for that parameter is:Ð<pre>{Ð initial: {Ð   'font-family': 'Verdana',Ð
'font-size': '12',Ð   'font-weight': 'bold',Ð   cursor: 'default',Ð   fill:
'black'Ð },Ð hover: {Ð   cursor: 'pointer'Ð }Ð}</pre>Ð* @param {Object}
params.markerStyle Set the styles for the map's markers. Any parameter
suitable for <code>regionStyle</code> could be used as well as numeric
parameter <code>r</code> to set the marker's radius. Default value for that
parameter is:Ð<pre>{Ð initial: {Ð   fill: 'grey',Ð   stroke: '#505050',Ð
"fill-opacity": 1,Ð
```

"stroke-width": 1,Ð "stroke-opacity": 1,Ð r: 5Ð },Ð hover: {Ð stroke: 'black',Ð "stroke-width": 2,Ð cursor: 'pointer'Ð },Ð selected: {Ð fill: 'blue'Ð },Ð selectedHover: {Ð }Ð}</pre>Ð* @param {Object} params.markerLabelStyle Set the styles for the markers' labels. Default value for that parameter is:Ð<pre>{Ð initial: {Ð 'font-family': 'Verdana',Ð 'font-size': '12',Ð 'font-weight': 'bold',Ð cursor: 'default',Ð fill: 'black'Ð },Ð hover: {Ð cursor: 'pointer'Ð }Ð}</pre>Ð* @param {Object|Array} params.markers Set of markers to add to the map during initialization. In case of array is provided, codes of markers will be set as string representations of array indexes. Each marker is represented by <code>latLng</code> (array of two numeric values), <code>name</code> (string which will be show on marker's tip) and any marker styles.Ð* @param {Object} params.series Object with two keys: <code>markers</code> and <code>regions</code>. Each of which is an array of series configs to be applied to the respective map elements. See <a href="jvm.DataSeries.html">DataSeries</a> description for a list of parameters available.Ð* @param {Object|String} params.focusOn This parameter sets the initial position and scale of the map viewport. See <code>setFocus</code> docuemntation for possible parameters.Ð* @param {Object} params.labels Defines parameters for rendering static labels. Object could contain two keys: <code>regions</code> and <code>markers</code>. Each key value defines configuration object with the following possible options:Ð <ul>Ð <li><code>render {Function}</code> - defines method for converting region code or marker index to actual label value.</li>Ð <li><code>offsets {Object|Function}</code> - provides method or object which could be used to define label offset by region code or marker index.</li>Ð</ul>ÐPlase note: static labels feature is not supported in Internet Explorer 8 and below.Ð * @param {Array|Object|String} params.selectedRegions Set initially selected regions.Ð* @param {Array|Object|String} params.selectedMarkers Set initially selected markers.Ð* @param {Function} params.onRegionTipShow <code>(Event e, Object tip, String code)</code> Will be called right before the region tip is going to be shown.Ð* @param {Function} params.onRegionOver <code>(Event e, String code)</code> Will be called on region mouse over event.Ð* @param {Function} params.onRegionOut <code>(Event e, String code)</code> Will be called on region mouse out event.Ð* @param {Function} params.onRegionClick <code>(Event e, String code)</code> Will be called on region click event.Ð* @param {Function} params.onRegionSelected <code>(Event e, String code, Boolean isSelected, Array selectedRegions)</code> Will be called when region is (de)selected. <code>isSelected</code> parameter of the callback indicates whether region is selected or not. <code>selectedRegions</code> contains codes of all currently selected regions.Ð* @param {Function} params.onMarkerTipShow <code>(Event e, Object tip, String code)</code> Will be called right before the marker tip is going to be shown.Ð* @param {Function} params.onMarkerOver <code>(Event e, String code)</code> Will be called on marker mouse over event.Ð* @param {Function} params.onMarkerOut <code>(Event e, String code)</code> Will be called on marker mouse out event.Ð * @param {Function} params.onMarkerClick <code>(Event e, String code)</code> Will be called on marker click event.Ð* @param {Function} params.onMarkerSelected <code>(Event e, String code, Boolean isSelected, Array selectedMarkers)</code> Will be called when marker is (de)selected. <code>isSelected</code> parameter of the callback indicates whether marker is selected or not. <code>selectedMarkers</code> contains codes of all currently selected markers.Ð* @param {Function} params.onViewportChange <code>(Event e, Number scale)</code> Triggered when the map's viewport is changed (map was panned or zoomed).Ð*/Ðjvm.Map = function(params) {Ð var map = this,Ð e;Ð this.params = jvm.$.extend(true, {}, jvm.Map.defaultParams, params);Ð if (!jvm.Map.maps[this.params.map]) {Ð throw new Error('Attempt to use map which was not loaded: '+this.params.map);Ð }Ð this.mapData = jvm.Map.maps[this.params.map];Ð this.markers = {};Ð this.regions = {};Ð this.regionsColors = {};Ð this.regionsData = {};Ð this.container = jvm.$(' ').addClass('jvectormap-container');Ð

  /** A template trait for traversable collections of type `Traversable[A]`.Ð
   *  Ð  *  $traversableInfoÐ  *  @define mutabilityÐ  *  @define
traversableInfoÐ  *  This is a base trait of all kinds of $mutability Scala
collections. ItÐ  *  implements the behavior common to all collections, in
terms of a methodÐ  *  `foreach` with signature:Ð  * {{{Ð  *     def
foreach[U](f: Elem => U): UnitÐ  * }}}Ð  *  Collection classes mixing in this
trait provide a concrete Ð  *  `foreach` method which traverses all theÐ  *
elements contained in the collection, applying a given function to each.Ð  *
They also need to provide a method `newBuilder`Ð  *  which creates a builder
for collections of the same kind.Ð  *  Ð  *  A traversable class might or
might not have two properties: strictnessÐ  *  and orderedness. Neither is
represented as a type.Ð  *  Ð  *  The instances of a strict collection class
have all their elementsÐ  *  computed before they can be used as values. By
contrast, instances ofÐ  *  a non-strict collection class may defer
computation of some of theirÐ  *  elements until after the instance is
available as a value.Ð  *  A typical example of a non-strict collection class
is aÐ  *  <a href="../immutable/Stream.html" target="ContentFrame">Ð  *
`scala.collection.immutable.Stream`</a>.Ð  *  A more general class of
examples are `TraversableViews`.Ð  *  Ð  *  If a collection is an instance of
an ordered collection class, traversingÐ  *  its elements with `foreach` will
always visit elements in theÐ  *  same order, even for different runs of the
program. If the class is notÐ  *  ordered, `foreach` can visit elements in
different orders forÐ  *  different runs (but it will keep the same order in
the same run).'Ð  * Ð  *  A typical example of a collection class which is
not ordered is aÐ  *  `HashMap` of objects. The traversal order for hash maps
willÐ  *  depend on the hash codes of its elements, and these hash codes mightÐ
   *  differ from one run to the next. By contrast, a `LinkedHashMap`Ð  *  is
ordered because it's `foreach` method visits elements in theÐ  *  order they
were inserted into the `HashMap`.Ð  *Ð  *  @author Martin OderskyÐ  *
@version 2.8Ð  *  @since   2.8Ð  *  @tparam A    the element type of the
collectionÐ  *  @tparam Repr the type of the actual collection containing the
elements.Ð  *Ð  *  @define Coll TraversableÐ  *  @define coll traversable

a&gt;&lt;/li&gt;Ð&lt;/ul&gt;ÐGetting the Gist of Markdown's Formatting SyntaxÐ
---------------------------------------------------Ð This page offers a brief
overview of what it's like to use Markdown.Ð The [syntax page] [s] provides
complete, detailed documentation forÐ every feature, but Markdown should be
very easy to pick up simply byÐ looking at a few examples of it in action. The
examples on this pageÐ are written in a before/after style, showing example
syntax and theÐ HTML output produced by Markdown.Ð It's also helpful to simply
try Markdown out; the [Dingus] [d] is aÐ web application that allows you type
your own Markdown-formatted textÐ and translate it to XHTML.Ð *Note:** This
document is itself written using Markdown; youÐ can [see the source for it by
adding '.text' to the URL] [src].Ð [s]: /projects/markdown/syntax  "Markdown
Syntax"Ð [d]: /projects/markdown/dingus  "Markdown Dingus"Ð [src]: /projects/
markdown/basics.textÐ# Paragraphs, Headers, Blockquotes ##Ð A paragraph is
simply one or more consecutive lines of text, separatedÐ by one or more blank
lines. (A blank line is any line that looks likeÐ a blank line -- a line
containing nothing but spaces or tabs isÐ considered blank.) Normal paragraphs
should not be indented withÐ spaces or tabs.Ð Markdown offers two styles of
headers: *Setext* and *atx*.Ð Setext-style headers for `&lt;h1&gt;` and
`&lt;h2&gt;` are created byÐ "underlining" with equal signs (`=`) and hyphens
(`-`), respectively.Ð To create an atx-style header, you put 1-6 hash marks
(`#`) at theÐ beginning of the line -- the number of hashes equals the resultingÐ
HTML header level.Ð Blockquotes are indicated using email-style ''&gt;`' angle
brackets.Ð Markdown:Ð   A First Level HeaderÐ   ====================Ð   Ð   A
Second Level HeaderÐ   ----------------------Ð   Now is the time for all good
men to come toÐ   the aid of their country. This is just aÐ   regular
paragraph.Ð   The quick brown fox jumped over the lazyÐ   dog's back.Ð   Ð
### Header 3Ð   &gt; This is a blockquote.Ð   &gt; Ð   &gt; This is the
second paragraph in the blockquote.Ð   &gt;Ð   &gt; ## This is an H2 in a
blockquoteÐ Output:Ð   &lt;h1&gt;A First Level Header&lt;/h1&gt;Ð   Ð
&lt;h2&gt;A Second Level Header&lt;/h2&gt;Ð   Ð   &lt;p&gt;Now is the time
for all good men to come toÐ   the aid of their country. This is just aÐ
regular paragraph.&lt;/p&gt;Ð   Ð   &lt;p&gt;The quick brown fox jumped over
the lazyÐ   dog's back.&lt;/p&gt;Ð   Ð   &lt;h3&gt;Header 3&lt;/h3&gt;Ð   Ð
&lt;blockquote&gt;Ð
```

<p>This is a blockquote.</p>Ð Ð
<p>This is the second paragraph in the blockquote.</p>Ð
Ð <h2>This is an H2 in a blockquote</h2>Ð </
blockquote>Ð## Phrase Emphasis ###ÐMarkdown uses asterisks and underscores
to indicate spans of emphasis.ÐMarkdown:Ð Some of these words *are
emphasized*.Ð Some of these words _are emphasized also_.Ð Ð Use two
asterisks for **strong emphasis**.Ð Or, if you prefer, __use two
underscores instead__.ÐOutput:Ð <p>Some of these words <em>are
emphasized</em>.Ð Some of these words <em>are emphasized
also</em>.</p>Ð Ð <p>Use two asterisks for
<strong>strong emphasis</strong>.Ð Or, if you prefer,
<strong>use two underscores instead</strong>.</p>Ð Ð#
Lists ##ÐUnordered (bulleted) lists use asterisks, pluses, and hyphens (`*`,Ð
`+`, and `-`) as list markers. These three markers areÐinterchangable; this:Ð
* Candy.Ð * Gum.Ð * Booze.ÐThis:Ð + Candy.Ð + Gum.Ð
+ Booze.ÐAnd this:Ð - Candy.Ð - Gum.Ð - Booze.ÐAll produce the
same output:Ð <ul>Ð <li>Candy.</li>Ð
<li>Gum.</li>Ð <li>Booze.</li>Ð </ul>Ð
Ordered (numbered) lists use regular numbers, followed by periods, asÐlist
markers:Ð 1. RedÐ 2. GreenÐ 3. BlueÐOutput:Ð <ol>Ð
<li>Red</li>Ð <li>Green</li>Ð <li>Blue</
li>Ð </ol>ÐIf you put blank lines between items, you'll get
`<p>` tags for theÐlist item text. You can create multi-paragraph list
items by indentingÐthe paragraphs by 4 spaces or 1 tab:Ð * A list item.Ð Ð
With multiple paragraphs.Ð * Another item in the list.ÐOutput:Ð
<ul>Ð <li><p>A list item.</p>Ð <p>With
multiple paragraphs.</p></li>Ð <li><p>Another item
in the list.</p></li>Ð </ul>Ð Ð## Links ###ÐMarkdown
supports two styles for creating links: *inline* andÐ*reference*. With both
styles, you use square brackets to delimit theÐtext you want to turn into a
link.ÐInline-style links use parentheses immediately after the link text.ÐFor
example:Ð This is an [example link](http://example.com/).ÐOutput:Ð
<p>This is an <a href="http://example.com/">Ð example link</
a>.</p>ÐOptionally, you may include a title attribute in the
parentheses:Ð This is an [example link](http://example.com/ "With a Title").Ð
Output:Ð <p>This is an <a href="http://example.com/" title="With a
Title">Ð example link</a>.</p>ÐReference-style links allow
you to refer to your links by names, whichÐyou define elsewhere in your
document:Ð I get 10 times more traffic from [Google][1] than fromÐ [Yahoo]
[2] or [MSN][3].Ð [1]: http://google.com/ "Google"Ð [2]: http://
search.yahoo.com/ "Yahoo Search"Ð [3]: http://search.msn.com/ "MSN
Search"ÐOutput:Ð <p>I get 10 times more traffic from <a
href="http://google.com/"Ð title="Google">Google</a> than from
<a href="http://search.yahoo.com/"Ð title="Yahoo Search">Yahoo</
a> or <a href="http://search.msn.com/"Ð title="MSN Search">MSN</
a>.</p>ÐThe title attribute is optional. Link names may contain
letters,Ðnumbers and spaces, but are *not* case sensitive:Ð I start my
morning with a cup of coffee andÐ [The New York Times][NY Times].Ð [ny
times]: http://www.nytimes.com/ÐOutput:Ð <p>I start my morning with a
cup of coffee andÐ <a href="http://www.nytimes.com/">The New York
Times</a>.</p>Ð## Images ###ÐImage syntax is very much like link
syntax.ÐInline (titles are optional):Ð ![alt text](/path/to/img.jpg "Title")Ð
Reference-style:Ð ![alt text][id]Ð [id]: /path/to/img.jpg "Title"ÐBoth of
the above examples produce the same output:Ð <img src="/path/to/img.jpg"
alt="alt text" title="Title" />Ð## Code ###ÐIn a regular paragraph, you can
create code span by wrapping text inÐbacktick quotes. Any ampersands (`&`)
and angle brackets (`<` orÐ`>`) will automatically be translated into
HTML entities. This makesÐit easy to use Markdown to write about HTML example
code:Ð I strongly recommend against using any `<blink>` tags.Ð I
wish SmartyPants used named entities like `—`Ð

instead of decimal-encoded entites like `—`.Ðutput:Ð <p>I strongly recommend against using anyÐ <code><blink></code> tags.</p>Ð Ð <p>I wish SmartyPants used named entities likeÐ <code>—</code> instead of decimal-encodedÐ entites like <code>—</code>.</p>Ðo specify an entire block of pre-formatted code, indent every line ofÐhe block by 4 spaces or 1 tab. Just like with code spans, `&`, `<`,Ðnd `>` characters will be escaped automatically.Ðarkdown:Ð If you want your page to validate under XHTML 1.0 Strict,Ð you've got to put paragraph tags in your blockquotes:Ð <blockquote>Ð <p>For example.</p>Ð </blockquote>Ðutput:Ð <p>If you want your page to validate under XHTML 1.0 Strict,Ð you've got to put paragraph tags in your blockquotes:</p>Ð Ð <pre><code><blockquote>Ð <p>For example.</p>Ð </blockquote>Ð </code></pre>Ð/textarea></form>Ð <script>Ð var editor = CodeMirror.fromTextArea(document.getElementById("code"), {Ð mode: 'markdown',Ð lineNumbers: true,Ð theme: "default",Ð extraKeys: {"Enter": "newlineAndIndentContinueMarkdownList"}Ð });Ð </script>Ð Optionally depends on the XML mode for properly highlighted inline XML blocks. Ð MIME types defined: <code>text/x-markdown</code>. Ð Parsing/Highlighting Tests: <a href="../../test/index.html#markdown_*">normal</a>, <a href="../../test/index.html#verbose,markdown_*">verbose</a>. Ð </article>Ð

This is an excerpt from Sphinx documentation: http://sphinx.pocoo.org/_sources/rest.txtÐ. highlightlang::restÐ. _rst-primer:ÐeStructuredText PrimerÐ==========ÐThis section is a brief introduction to reStructuredText (reST) concepts andÐsyntax, intended to provide authors with enough information to author documentsÐ productively. Since reST was designed to be a simple, unobtrusive markupÐ language, this will not take too long.Ð. seealso::Ð The authoritative `reStructuredText User DocumentationÐ  <http://docutils.sourceforge.net/rst.html>`_. The "ref" links in thisÐ document link to the description of the individual constructs in the reSTÐ reference.ÐparagraphsÐ---------ÐThe paragraph (:duref:`ref <paragraphs>`) is the most basic block in a reSTÐ document. Paragraphs are simply chunks of text separated by one or more blankÐ lines. As in Python, indentation is significant in reST, so all lines of theÐ same paragraph must be left-aligned to the same level of indentation.Ð. _inlinemarkup:ÐInline markupÐ------------ÐThe standard reST inline markup is quite simple: useÐ one asterisk: ``*text*`` for emphasis (italics),Ð two asterisks: ``**text**`` for strong emphasis (boldface), andÐ backquotes: ``text`` for code samples.ÐIf asterisks or backquotes appear in running text and could be confused withÐinline markup delimiters, they have to be escaped with a backslash.ÐBe aware of some restrictions of this markup:Ð it may not be nested,Ð content may not start or end with whitespace: ``* text*`` is wrong,Ð it must be separated from surrounding text by non-word characters. Use aÐ backslash escaped space to work around that: ``thisis\ *one*\ word``.ÐThese restrictions may be lifted in future versions of the docutils.ÐreST also allows for custom "interpreted text roles"', which signify that theÐenclosed text should be interpreted in a specific way. Sphinx uses this toÐprovide semantic markup and cross-referencing of identifiers, as described inÐthe appropriate section. The general syntax is ``:rolename:`content```.ÐStandard reST provides the following roles:Ð * :durole:`emphasis` -- alternate spelling for ``*emphasis*``Ð * :durole:`strong` -- alternate spelling for ``**strong**``Ð * :durole:`literal` -- alternate spelling for ``literal``Ð * :durole:`subscript` -- subscript textÐ :durole:`superscript` -- superscript textÐ :durole:`title-reference` -- for titles of books, periodicals, and otherÐ materialsÐSee :ref:`inline-markup` for roles added by Sphinx.ÐLists and Quote-like blocksÐ----------ÐList markup (:duref:`ref <bullet-lists>`) is natural: just place an asterisk atÐthe start of a paragraph and indent properly. The same goes for numbered lists;ÐThey can also be autonumbered using a ``#`` sign::Ð * This is a bulleted list.Ð * It has two items, the secondÐ item uses two lines.Ð 1. This is a numbered list.Ð 2. It has two items too.Ð #. This is a numbered list.Ð #. It has two items too.Ð Nested lists are possible, but be aware that they must be separated from theÐ parent list items by blank lines::Ð * this isÐ * a listÐ * with a nested listÐ * and some subitemsÐ * and here the parent list continuesÐdefinition lists (:duref:`ref <definition-lists>`) are created as follows::Ð term (up to a line of text)Ð Definition of the term, which must be indentedÐ and can even consist of multiple paragraphsÐ

Ð next termÐ
Description.Ð Note that the term cannot have more than one line of text.Ð Quoted
paragraphs (:duref:`ref <block-quotes>`) are created by just indentingÐ
them more than the surrounding paragraphs.Ð Line blocks (:duref:`ref <line-
blocks>`) are a way of preserving line breaks::Ð | These lines areÐ |
broken exactly like inÐ | the source file.Ð There are also several more
special blocks available:Ð field lists (:duref:`ref <field-lists>`)Ð
option lists (:duref:`ref <option-lists>`)Ð quoted literal blocks
(:duref:`ref <quoted-literal-blocks>`)Ð doctest blocks (:duref:`ref
<doctest-blocks>`)Ð Source CodeÐ----------Ð Literal code blocks
(:duref:`ref <literal-blocks>`) are introduced by ending aÐ paragraph
with the special marker ``::``. The literal block must be indentedÐ (and, like
all paragraphs, separated from the surrounding ones by blank lines)::Ð This
is a normal text paragraph. The next paragraph is a code sample::Ð   It is
not processed in any way, exceptÐ   that the indentation is removed.Ð
It can span multiple lines.Ð This is a normal text paragraph again.Ð The
handling of the ``::`` marker is smart:Ð If it occurs as a paragraph of its
own, that paragraph is completely leftÐ out of the document.Ð If it is
preceded by whitespace, the marker is removed.Ð If it is preceded by non-
whitespace, the marker is replaced by a singleÐ colon.Ð That way, the second
sentence in the above example's first paragraph would beÐ rendered as "The next
paragraph is a code sample:".Ð. _rst-tables:Ð TablesÐ-----Ð Two forms of tables
are supported. For *grid tables* (:duref:`refÐ <grid-tables>`), you have
to "paint" the cell grid yourself. They look likeÐ this::Ð
+------------------------+------------+----------+----------+Ð | Header row,
column 1 | Header 2 | Header 3 | Header 4 |Ð | (header rows optional)
| | | |Ð
+========================+============+==========+==========+Ð | body row 1,
column 1 | column 2 | column 3 | column 4 |Ð +------------------------
+------------+----------+----------+Ð | body row 2 | ...
| ... | |Ð +------------------------+------------+----------
+----------+Ð Simple tables* (:duref:`ref <simple-tables>`) are easier
to write, butÐ limited: they must contain more than one row, and the first
column cannotÐ contain multiple lines. They look like this::Ð ===== =====
=======Ð A   B   A and BÐ ===== ===== =======Ð False False FalseÐ
   True   False FalseÐ False True   FalseÐ True   True   TrueÐ =====
===== =======Ð Hyperlinks:Ð---------Ð External linksÐ^^^^^^^^^^^^^^Ð Use ```Link
text <http://example.com/>`_`` for inline web links. If the linkÐ text
should be the web address, you don't need special markup at all, the parserÐ
finds links and mail addresses in ordinary text.Ð You can also separate the
link and the target definition (:duref:`refÐ <hyperlink-targets>`), like
this::Ð This is a paragraph that contains `a link`_.Ð .. _a link: http://
example.com/Ð Internal linksÐ^^^^^^^^^^^^^^Ð Internal linking is done via a
special reST role provided by Sphinx, see theÐ section on specific
markup, :ref:`ref-role`.Ð SectionsÐ-------Ð Section headers (:duref:`ref
<sections>`) are created by underlining (andÐ optionally overlining) the
section title with a punctuation character, at leastÐ as long as the text::Ð
==================Ð This is a headingÐ ==================Ð Normally, there are
no heading levels assigned to certain characters as theÐ structure is
determined from the succession of headings. However, for theÐ Python
documentation, this convention is used which you may follow:Ð ``#`` with
overline, for partsÐ ``*`` with overline, for chaptersÐ ``=``, for sectionsÐ
``-``, for subsections:Ð ``^``, for subsubsections:Ð ``"``, for paragraphsÐ Of
course, you are free to use your own marker characters (see the reSTÐ
documentation), and use a deeper nesting level, but keep in mind that mostÐ
target formats (HTML, LaTeX) have a limited supported nesting depth.Ð Explicit
MarkupÐ--------------Ð Explicit markup" (:duref:`ref <explicit-markup-
blocks>`) is used in reST forÐ most constructs that need special handling,
such as footnotes,Ð specially-highlighted paragraphs, comments, and generic
directives.Ð

Ð An explicit markup block begins with a line starting with ``..`` followed by Ðwhitespace and is terminated by the next paragraph at the same level of Ðindentation. (There needs to be a blank line between explicit markup and normal Ðparagraphs. This may all sound a bit complicated, but it is intuitive enough Ðwhen you write it.)Ð. _directives:ÐDirectivesÐ---------Ð A directive (:duref:`ref <directives>`) is a generic block of explicit markup.Ðesides roles, it is one of the extension mechanisms of reST, and Sphinx makes Ðheavy use of it.Ðocutils supports the following directives:Ð Admonitions: :dudir:`attention`, :dudir:`caution`, :dudir:`danger`,Ð :dudir:`error`, :dudir:`hint`, :dudir:`important`, :dudir:`note`,Ð :dudir:`tip`, :dudir:`warning` and the generic :dudir:`admonition`.Ð (Most themes style only "note" and "warning" specially.)Ð Images:Ð - :dudir:`image` (see also Images_ below)Ð - :dudir:`figure` (an image with caption and optional legend)Ð Additional body elements:Ð - :dudir:`contents` (a local, i.e. for the current file only, table ofÐ contents)Ð - :dudir:`container` (a container with a custom class, useful to generate anÐ outer ``<div>`` in HTML)Ð - :dudir:`rubric` (a heading without relation to the document sectioning)Ð - :dudir:`topic`, :dudir:`sidebar` (special highlighted body elements)Ð - :dudir:`parsed-literal` (literal block that supports inline markup)Ð - :dudir:`epigraph` (a block quote with optional attribution line)Ð - :dudir:`highlights`, :dudir:`pull-quote` (block quotes with their ownÐ class attribute)Ð - :dudir:`compound` (a compound paragraph)Ð * Special tables:Ð - :dudir:`table` (a table with title)Ð - :dudir:`csv-table` (a table generated from comma-separated values)Ð - :dudir:`list-table` (a table generated from a list of lists)Ð Special directives:Ð - :dudir:`raw` (include raw target-format markup)Ð - :dudir:`include` (include reStructuredText from another file)Ð -- in Sphinx, when given an absolute include file path, this directive takesÐ it as relative to the source directoryÐ - :dudir:`class` (assign a class attribute to the next element) [1]_Ð HTML specifics:Ð - :dudir:`meta` (generation of HTML ``<meta>`` tags)Ð - :dudir:`title` (override document title)Ð Influencing markup:Ð - :dudir:`default-role` (set a new default role)Ð - :dudir:`role` (create a new role)Ð Since these are only per-file, better use Sphinx' facilities for setting theÐ :confval:`default_role`.Ðo *not* use the directives :dudir:`sectnum`, :dudir:`header` andÐdudir:`footer`.Ðirectives added by Sphinx are described in :ref:`sphinxmarkup`.Ðasically, a directive consists of a name, arguments, options and content. (KeepÐhis terminology in mind, it is used in the next chapter describing customÐirectives.) Looking at this example, ::Ð .. function:: foo(x)Ð foo(y, z)Ð :module: some.module.nameÐ Return a line of text input from the user.Ð`function`` is the directive name.  It is given two arguments here, theÐ remainder of the first line and the second line, as well as one optionÐ ``module`` (as you can see, options are given in the lines immediately followingÐhe arguments and indicated by the colons). Options must be indented to theÐame level as the directive content.Ðhe directive content follows after a blank line and is indented relative to theÐirective start.Ð ImagesÐ-----ÐeST supports an image directive (:dudir:`ref <image>`), used like so::Ð .. image:: gnu.pngÐ (options)Ðhen used within Sphinx, the file name given (here ``gnu.png``) must either beÐelative to the source file, or absolute which means that they are relative toÐhe top source directory. For example, the file ``sketch/spam.rst`` could referÐo the image ``images/spam.png`` as ``../images/spam.png`` orÐ`/images/spam.png``.Ðphinx will automatically copy image files over to a subdirectory of the outputÐ directory on building (e.g. the ``_static`` directory for HTML output.)Ð Interpretation of image size options (``width`` and ``height``) is as follows:Ð if the size has no unit or the unit is pixels, the given size will only beÐ respected for output channels that support pixels (i.e. not in LaTeX output).Ð Other units (like ``pt`` for points) will be used for HTML and LaTeX output.Ð Sphinx extends the standard docutils behavior by allowing an asterisk for theÐ extension::Ð

Ð .. image:: gnu.*Ðphinx then searches for all images matching the provided pattern and determinesÐheir type. Each builder then chooses the best image out of these candidates.Ðor instance, if the file name ``gnu.*`` was given and two files :file:`gnu.pdf`Ðnd :file:`gnu.png` existed in the source tree, the LaTeX builder would chooseÐhe former, while the HTML builder would prefer the latter.Ð. versionchanged:: 0.4Ð Added the support for file names ending in an asterisk.Ð. versionchanged:: 0.6Ð Image paths can now be absolute.ÐootnotesÐ--------Ðor footnotes (:duref:`ref <footnotes>`), use ``[#name]_`` to mark the footnoteÐocation, and add the footnote body at the bottom of the document after aÐFootnotes" rubric heading, like so::Ð Lorem ipsum [#f1]_ dolor sit amet ... [#f2]_Ð .. rubric:: FootnotesÐ .. [#f1] Text of the first footnote.Ð .. [#f2] Text of the second footnote.ÐYou can also explicitly number the footnotes (``[1]_``) or use auto-numberedÐ footnotes without names (``[#]_``).ÐitationsÐ--------ÐtandardreST citations (:duref:`ref <citations>`) are supported, with theÐdditional feature that they are "global", i.e. all citations can be referencedÐrom all files. Use them like so::Ð Lorem ipsum [Ref]_ dolor sit amet.Ð .. [Ref] Book or article reference, URL or whatever.Ðitation usage is similar to footnote usage, but with a label that is notÐumeric or begins with ``#``.ÐubstitutionsÐ ----------ÐeST supports "substitutions" (:duref:`ref <substitution-definitions>`), whichÐre pieces of text and/or markup referred to in the text by ``|name|``. TheyÐre defined like footnotes with explicit markup blocks, like this::Ð .. |name| replace:: replacement *text*Ðr this::Ð .. |caution| image:: warning.pngÐ   :alt: Warning!ÐSee the :duref:`reST reference for substitutions <substitution-definitions>`Ð for details.ÐIf you want to use some substitutions for all documents, put them intoÐconfval:`rst_prolog` or put them into a separate file and include it into allÐocuments you want to use them in, using the :rst:dir:`include` directive. (BeÐure to give the include file a file name extension differing from that of otherÐource files, to avoid Sphinx finding it as a standalone document.)ÐphinxdefinesÐome default substitutions, see :ref:`default-substitutions`.ÐommentsÐ--------ÐEvery explicit markup block which isn't a valid markup construct (like theÐootnotes above) is regarded as a comment (:duref:`ref <comments>`). ForÐxample::Ð .. This is a comment.ÐYou can indent text after a comment start to form multiline comments::Ð ..Ð   This whole indented blockÐ   is a comment.Ð   Still in the comment.ÐSource encodingÐ--------------ÐSince the easiest way to include special characters like em dashes or copyrightÐigns in reST is to directly write them as Unicode characters, one has toÐpecify an encoding. Sphinx assumes source files to be encoded in UTF-8 byÐefault; you can change this with the :confval:`source_encoding` config value.ÐotchasÐ--------ÐThere are some problems one commonly runs into while authoring reST documents:Ð **Separation of inline markup:** As said above, inline markup spans must beÐ separated from the surrounding text by non-word characters, you have to use aÐ backslash-escaped space to get around that. See `the referenceÐ <http://docutils.sf.net/docs/ref/rst/restructuredtext.html#inline-markup>`_Ð for the details.Ð **No nested inline markup:** Something like ``*see :func:`foo`*`` is notÐ possible.Ð. rubric:: FootnotesÐ. [1] When the default domain contains a :rst:dir:`class` directive, this directiveÐ will be shadowed. Therefore, Sphinx re-exports it as :rst:dir:`rst-class`.Ð</textarea></form>Ð <script>Ð   var editor = CodeMirror.fromTextArea(document.getElementById("code"), {Ð lineNumbers: true,Ð   });Ð </script>Ð Ð   The <code>python</code> mode will be used for highlighting blocksÐ   containing Python/IPython terminal sessions: blocks starting withÐ   <code>>>></code> (for Python) or <code>In [num]:</code> (forÐ   IPython).Ð Further, the <code>stex</code> mode will be used for highlightingÐ blocks containing LaTex code.Ð Ð MIME types defined: <code>text/x-rst</code>.
